

Center for Urological Care

Kidney Cancer: Treatment and Management

The team at the UC Irvine Health Center for Urological Care has the world's longest and most robust collective experience with minimally invasive management of kidney cancer. As international leaders in the treatment of kidney cancer, our surgeons' comprehensive experience with all kidney cancer treatment modalities allows for patients to have personalized treatment strategies tailored to their specific needs.

Our goal is to return patients to your practice.

In addition to providing world-class care, we are dedicated to partnering with our colleagues in the community. You will have full access to a referral concierge who will facilitate every step of the referral process. We ensure that your

patients are scheduled in a timely manner, with the goal of returning your patients to your practice upon completion of treatment.

In-office kidney biopsy

The UC Irvine Health team was the first team in the world to routinely employ advanced ultrasound targeting technologies to biopsy small renal masses in the office. Patients experience little pain, and the histology information gained allows the team to offer treatment strategies targeted to your patient's specific disease.

Robot-assisted laparoscopic partial nephrectomy

The UC Irvine Health team is among the most experienced in the world with laparoscopic and robot-assisted partial nephrectomy using the da Vinci Surgical System®. The combination of the world's best technology and most experienced surgeons results in high success rates with fewer complications. Our surgeons are dedicated to using the most sophisticated technology available to precisely remove kidney cancer while preserving as much normal kidney function as possible.

Laparoscopic and percutaneous kidney cryoablation

UC Irvine Health urologists collectively have among the longest experience with kidney cancer ablation in the world, and direct a comprehensive ablative oncology center. By partnering with interventional radiologists and other physicians, we are able to offer an unparalleled level of quality and safety with our ablation procedures. Our team developed special techniques to ablate kidney cancer using minimally invasive treatment. Using state-of-the-art, image-guided technologies and by precisely inserting probes unto the kidney tumors, our surgeons are able to completely ablate kidney cancer by applying cold or heat energy. Cryoablation therapy offers appropriately selected patients the most minimally invasive treatment option, and many patients are cured of their disease on an outpatient basis without visible scars.
